

How to clean silicone sealant

1. When the glass glue is not cured, whether it sticks to the human body, utensils or clothing, it can be easily removed by washing with water, so the uncured glass glue is the easiest to clean. ??

2. Then there is the cured glass glue, which is extremely difficult to remove. If the solidified colloid is attached to glass, ceramics, metal and other items, you can consider scrubbing with solvents such as xylene and acetone (if you do not know these two substances, you can consider banana water, because banana water contains these two substances), If the cured glue attached to glass and other items is relatively small, you can also consider scraping it off with a scraper. If it is attached to the clothes, you can consider using a brush to brush it, if not, you should consider banana water. ??

3. There is another situation that the glass glue sticks to the hand and solidifies. Don't worry about this situation, the handling is very simple. After the glass glue is cured, it is not sticky to the hand, so it can be removed by rubbing it with both hands for a few times.
